

## Blades for Safer Gravel Roads

### **CARBIT and CARBIT LINK Non-Rotating and Rotating Tooth Blade Systems:**

St. Regis Culvert is an authorized dealer of Valley Blades Limited. Our partnership over the past three decades has enabled us to bring you leading technology for extended performance at an economical price. We are keeping you up to date with another innovative idea to support you in maintaining better gravel roads. The new CARBIT LINK system improves on the original CARBIT system design by manufacturing the blade into 12" by 30lbs. segments making them safer and easier for one person to handle, helping to reduce injury. The sectional design also makes storage easier for applications where scarifying is only done at certain times of the year. The locking sectional designs eliminate joints between blades making for a more rigid installation and are heat treated for strength. Tungsten Carbide Matrix (TCM) wear protection comes as standard for the best possible wear life. Bits are available with a full range of standard 7/8" (22mm) rotating and non-rotating bits. The VBL™ TAPER-LOCK™ tool brings non-rotating bits to the next level with an extremely secure mounting system that ensures easy removal of bits even after years of use. These systems are available to fit both graders and underbody truck mounts. The Carbit rotating tooth blade systems gets your gravel roads to ride like new without the cost of additional material. For more information and pricing contact your St Regis representative at 1-800-527-4604.
